How to read it. Blue rows are the five agents in the methodology. Numbers in brackets are approximate GitHub hits (Oct 2026; commits unless it says PRs). **Id** = the number in the bot's email `<id>+<login>@users.noreply.github.com`. (robot) / (heart) stand for the emoji the agent writes. A dash means the agent leaves no trace of that kind.

Rules. 1) Trust the **email**, not the name: `Kimi <noreply@anthropic.com>` is Claude Code. 2) Match only exact trailers, emails, logins and branch **prefixes**; “move the cursor” is not Cursor. 3) No trace never means human (traces can be turned off), so results are a minimum. 4) AI reviewers (CodeRabbit, Copilot review, Gemini Code Assist) review, they don't write. 5) Exclude automation: dependabot, renovate, github-actions. 6) `Co-authored-by: Copilot` was added by mistake to human commits in VS Code 1.117–1.118 (Apr–May 2026). 7) AGENTS.md shows some agent, not which one.

Edit velocity = (lines added + lines deleted) ÷ seconds since the same author's previous commit. Use the **author date**, group by author email, skip each author's first commit, and leave out merge commits, squash merges and lockfile-only commits. Flag the fastest 5% (95th percentile). Example: +600 lines 90 s after the previous commit = 6.7 lines/s, far faster than typing. Watch out for tiny gaps (1 s gives huge values): use a minimum gap or log(velocity).
